Slightly colder air will only temporarily reach us from North Europe. This is caused by a northwesterly current which will rapidly be affected by high-pressure from Friday onwards consequently a significant weather improvement will set in just in time for the weekend. Residual clouds will make way for sunny conditions already on Friday. For the moment, the temperatures will still remain autumnally cool, freezing temperatures are forecast for the upcoming clear nights, despite the rising temperatures expected from Sunday onwards. The forecast for the beginning of next week seems to be positive too. Slightly more changeable and cooler temperatures are expected on Tuesday only. A longer period of stable high-pressure weather is indicated afterwards. Mild air masses will increasingly set in from the western Mediterranean region.
